

Quality "Made in Germany"

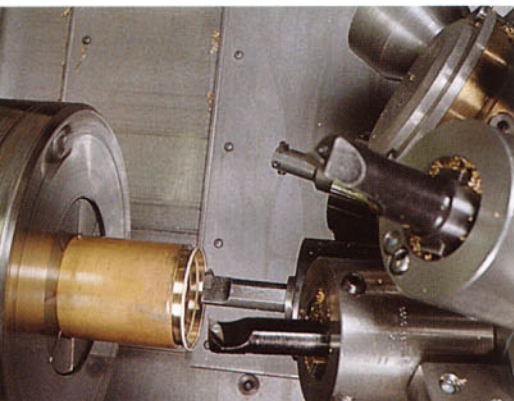

A hollow, diamond drill produces perfect glass cylinders from a solid block of Schott glass.

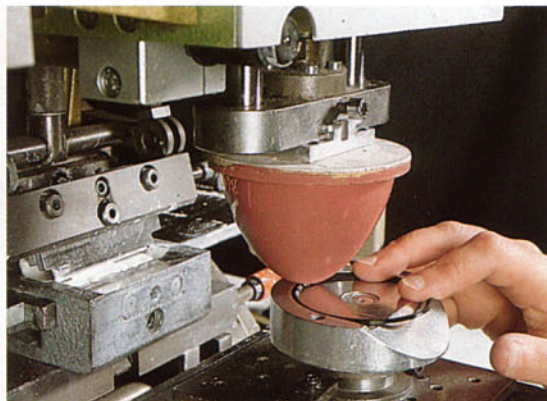

With the latest generation coating chamber, B+W filters are coated with the new proprietary Multi-Resistant Coating MRC.

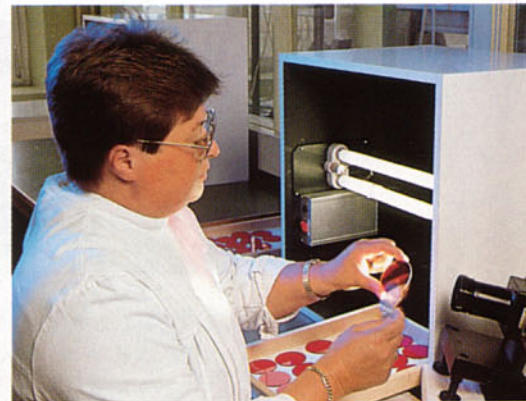

A laser interferometer examines each glass filter for flatness and plane-parallelism.

CNC-controlled machines accurately produce filter mounting rings of different sizes and specifications.

A precise printing process imprints individual filter mounts.

Each filter receives individual hand inspection before leaving the factory and being shipped to our customers around the world.
